

## 1.4 Matrix Group

June 12, 2026

### Matrix Group

**Definition 0.1.** In  $\mathbb{C}^n$ ,  $\bar{e}_i = (0, \dots, 1^{\text{th}}, 0, \dots)$  is a vector space basis element.

**Definition 0.2.** An *endomorphism*  $\alpha$  of  $\mathbb{C}^n$  is defined as

$$\alpha \bar{e}_i = \sum_{j=1}^n a_{ji} \bar{e}_j$$

where  $\alpha = (a_{ij}) \in M_n(\mathbb{C})$ . (We can think of  $\alpha \bar{e}_i$  as the  $i^{\text{th}}$  column vector.)

We use  $\alpha$  for a matrix as well as for the endomorphism.

We define multiplication of two endomorphisms  $\alpha, \beta$  with corresponding matrices  $(a_{ij}), (b_{ij})$  and construct  $(c_{ij})$  where

$$c_{ij} = \sum_{k=1}^n a_{ik} b_{kj}.$$

**Lemma 0.1.**  $M_n(\mathbb{C}) \cong \mathbb{C}^{n^2}$  as vector spaces.

*Proof.* Construct the function

$$\begin{aligned} f: M_n(\mathbb{C}) &\rightarrow \mathbb{C}^{n^2}, \\ (a_{ij}) &\mapsto (b_{ij}), \end{aligned}$$

where  $b_{i+(j-1)n} = a_{ij}$ .

Observe as  $j$  goes from 1 to  $n$ ,  $(j-1)n$  goes from 0 to  $(n-1)n$  and as  $i$  goes from 1 to  $n$  as well, we get  $i + (j-1)n$  go from 1 to  $n^2$ .

Observe  $f$  is surjective by construction and if  $a_{ij} \neq a_{i'j'}$  then  $b_{i+(j-1)n} \neq b_{i'+(j'-1)n}$  hence  $f$  is bijective.

Observe  $f$  is linear hence  $M_n(\mathbb{C}) \cong \mathbb{C}^{n^2}$ . □

*Remark 0.1.* Observe we can equip  $M_n(\mathbb{C})$  with a topology by ensuring the given map above to be a homeomorphism. By constructing

$$\mathcal{T}_{M_n(\mathbb{C})} = \{f^{-1}(U) \mid U \in \mathcal{T}_{\mathbb{C}^{n^2}}\}.$$

**Lemma 0.2.** Let  $T$  be any topological space,

$$\phi: T \rightarrow M_n(\mathbb{C}).$$

$\phi$  is continuous if and only if  $\pi_{ij} \circ \phi$  is continuous.

*Proof.* Only if condition is trivial.

If condition:

$$\pi_{ij} \circ \phi: T \rightarrow \mathbb{C} \text{ is continuous.}$$

Now  $\prod_{1 \leq i, j \leq n} \pi_{ij} \circ \phi: T \rightarrow \mathbb{C}^{n^2}$  is continuous by product topology (or box topology as  $\mathbb{C}^{n^2}$  is finite Cartesian product).  $\square$

**Corollary 0.1.** The product of two matrices is continuous.

*Proof.* Consider the map

$$q: M_n(\mathbb{C}) \times M_n(\mathbb{C}) \rightarrow M_n(\mathbb{C})$$

defined by matrix multiplication, i.e.,

$$q(\sigma, \tau) = \sigma\tau.$$

We can factor  $q$  as follows:

$$\begin{array}{ccc} M_n(\mathbb{C}) \times M_n(\mathbb{C}) & \xrightarrow{q} & M_n(\mathbb{C}) \\ \downarrow f \times f & & \downarrow f \\ \mathbb{C}^{n^2} \times \mathbb{C}^{n^2} & \xrightarrow{\rho} & \mathbb{C}^{n^2} \end{array}$$

where  $f: M_n(\mathbb{C}) \rightarrow \mathbb{C}^{n^2}$  is the isomorphism identifying matrices with their entries, and  $\rho$  is a polynomial map defined by

$$\rho((b_{ij}), (b'_{ij})) = (c_{ij}),$$

with

$$c_{ij} = \sum_{k=1}^n b_{ik} b'_{kj}.$$

Since  $\rho$  is a polynomial map, it is continuous. The map  $f$  is a homeomorphism, and thus  $f \times f$  is also continuous. Therefore, the composition  $q = f \circ \rho \circ (f \times f)$  is continuous.

For any open set  $U$  in  $M_n(\mathbb{C})$ , we can express  $U = f^{-1}(O)$  for some open set  $O$  in  $\mathbb{C}^{n^2}$ . Since  $q$  is continuous, the preimage  $q^{-1}(U)$  is open in  $M_n(\mathbb{C}) \times M_n(\mathbb{C})$ . This proves the continuity of the matrix product.  $\square$

$$q^{-1}(U) = q^{-1}(f^{-1}(O)) = (f \circ q)^{-1}(O)$$

which is open as  $f \circ q$  is continuous.

$\square$

**Notation:**  ${}^tA$  is the transpose of a matrix and  $\bar{A}$  is the complex conjugate of a matrix.

**Lemma 0.3.** Transpose and complex conjugate are homeomorphisms.

*Proof.* If  $h: M_n(\mathbb{C}) \rightarrow M_n(\mathbb{C})$  is defined by

$$A \mapsto {}^tA,$$

we can construct  $r : \mathbb{C}^{n^2} \rightarrow \mathbb{C}^{n^2}$  which is a rearrangement of indices such that

$$b_{i+jn} = b_{j+in},$$

which is a homeomorphism. Hence,  $h = f^{-1} \circ r \circ f$  is a homeomorphism.

If  $k : M_n(\mathbb{C}) \rightarrow M_n(\mathbb{C})$  is homeomorphic by

$$A \mapsto \overline{A},$$

□

as  $k_{ij}$  is homeomorphic for  $1 \leq i, j \leq n$ .

*Remark 0.2.* Properties of matrices:

$$\begin{aligned} (\alpha\beta)^t &= \beta^t \alpha^t \\ \frac{d(\alpha\beta)}{dt} &= \dot{\alpha}\beta + \alpha\dot{\beta} \end{aligned}$$

**Definition 0.3.** A regular (non-singular)  $n \times n$  matrix, if it has an inverse, i.e., if there exists a matrix  $\sigma^{-1}$  such that

$$\sigma\sigma^{-1} = \sigma^{-1}\sigma = E,$$

where  $E$  is the unit matrix of degree  $n$ .

A necessary and sufficient condition for  $\sigma$  to be regular is  $\det \sigma \neq 0$ .

*Remark 0.3.* If  $\sigma$  is a regular matrix, then:

- (i) iff  $\sigma^{-1}$  (the reciprocal endomorphism) exists;
- (ii) then  ${}^t(\sigma^{-1}) = ({}^t\sigma)^{-1}$ ,  $(\overline{\sigma})^{-1} = \overline{(\sigma^{-1})}$ .

*Remark 0.4.* If  $\sigma, \tau$  are regular matrices, then  $\sigma\tau$  are regular matrices.

*Definition 0.4.* The determinant map

$$\det : M_n(\mathbb{C}) \rightarrow \mathbb{C}$$

can be expressed as

$$\begin{array}{ccc} M_n(\mathbb{C}) & \xrightarrow{\det} & \mathbb{C} \\ \downarrow f & & \\ \mathbb{C}^{n^2} & \xrightarrow{p} & \mathbb{C} \end{array}$$

where  $p$  is some polynomial function of  $n^2$  variables, which is continuous. We know  $f$  is continuous. Hence, the determinant map is continuous.

*Remark 0.5.*

$$\begin{aligned} GL_n(\mathbb{C}) &= \{\sigma \in M_n(\mathbb{C}) \mid \det \sigma \neq 0\} \\ &= M_n(\mathbb{C}) \setminus \det^{-1}\{0\} \end{aligned}$$

is a group and an open subset as  $\det$  is a continuous map.

(ii) For  $\sigma = (a_{ij}) \in GL_n(\mathbb{C})$  the coefficient  $b_{ij}$  of  $\sigma^{-1}$  are given by

$$b_{ij} = \frac{1}{\det \sigma} A_{ji},$$

where  $A_{ji}$  is a polynomial of  $\sigma$ . Hence mapping  $\sigma \mapsto \sigma^{-1}$  is continuous on  $GL(n, \mathbb{C})$ . Moreover, it's a homeomorphism.

*Remark 0.6.* If  $\sigma \in GL_n(\mathbb{C})$ , we define  $\sigma^* = ({}^t\sigma)^{-1}$ . Then we have  $(\sigma\tau)^* = \sigma^*\tau^*$ . Hence  $\sigma \mapsto \sigma^*$  is a homeomorphism, and an automorphism of order 2 of  $GL_n(\mathbb{C})$ .

**Definition 0.5.** Let  $O_n(\mathbb{C}) = \{\sigma \in GL_n(\mathbb{C}) \mid \sigma^* = \sigma^{-1}\}$  be the set of orthogonal matrices. If  $\sigma = \sigma^*$ , then  $\sigma$  is called *complex orthogonal*. If  $\sigma = \sigma^* = \bar{\sigma}$ , then  $\sigma$  is called *real orthogonal*.

**Definition 0.6.** Let  $U_n(\mathbb{C}) = \{\sigma \in GL_n(\mathbb{C}) \mid \sigma^* = \bar{\sigma}^{-1}\}$  be the set of all unitary matrices.

*Remark 0.7.* Note that  $U_n(\mathbb{C})$  or  $O_n(\mathbb{C})$  are non-empty as  $e \in U_n(\mathbb{C})$  and  $e \in O_n(\mathbb{C})$ , where  $e$  denotes the identity matrix.

*Remark 0.8.* Notation:  $U_n(\mathbb{C}) = U(n)$  and  $O_n(\mathbb{R}) = O(n)$ . Do not be confused!

**Lemma 0.4.** If  $f, g$  are continuous mappings from topological space  $X$  to Hausdorff space  $Y$ , then  $\{x \in X \mid f(x) = g(x)\}$  is closed.

*Proof.* Consider  $\{x \mid f(x) \neq g(x)\}$ . Now  $x \in \{x \in X \mid f(x) \neq g(x)\}$  implies  $f(x) \neq g(x)$  in  $Y$ . By Hausdorff property there exists open set  $U_1$  and  $U_2$  such that  $f(x) \in U_1$  and  $g(x) \in U_2$  and  $U_1 \cap U_2 = \emptyset$ . Now  $f^{-1}(U_1)$  and  $g^{-1}(U_2)$  are open. Let  $V = f^{-1}(U_1) \cap g^{-1}(U_2)$  be a nbd of  $x$ . For any  $y \in V$ ,  $f(y) \neq g(y)$  otherwise  $U_1 \cap U_2 \neq \emptyset$ . Hence  $x \in V \subseteq \{x \mid f(x) \neq g(x)\}$  is open. Hence  $\{x \mid f(x) = g(x)\}$  is closed.  $\square$

**Proposition 0.1.**  $O_n(\mathbb{C})$ ,  $U(n)$ ,  $O(n)$  are closed subgroups of  $GL_n(\mathbb{C})$ .

*Proof.* Observe that the mappings  $\sigma \mapsto \sigma^*$ ,  $\sigma \mapsto \bar{\sigma}$ , and the identity mapping are continuous.

By the above lemma, as  $\mathbb{R}$  is a  $T_2$  space, the sets

$$U(n) = \{\sigma \in GL_n(\mathbb{C}) \mid \sigma = \sigma^*\bar{\sigma}\}$$

and

$$O_n(\mathbb{C}) = \{\sigma \in GL_n(\mathbb{C}) \mid \sigma = \sigma^*\bar{\sigma}^T\}$$

are closed sets. Observe that

$$GL_n(\mathbb{R}) = \{\sigma \in GL_n(\mathbb{C}) \mid \sigma = \bar{\sigma}\}$$

is also closed. Hence  $U(n)$  and

$$O(n) = O_n(\mathbb{C}) \cap GL_n(\mathbb{R})$$

is closed.

As all the given sets are non-empty by subgroup test, we can show these are subgroups.  $\square$

**Definition 0.7.** The special linear group is defined as

$$SL_n(\mathbb{C}) = \{\sigma \in GL_n(\mathbb{C}) \mid \det \sigma = 1\}.$$

*Proof.* As  $\sigma \in SL_n(\mathbb{C})$ , and by subgroup tests, we can show  $SL_n(\mathbb{C})$  is a subgroup of  $GL_n(\mathbb{C})$ . Moreover,  $SL_n(\mathbb{C}) = \det^{-1}\{1\}$  implies  $SL_n(\mathbb{C})$  is a closed subgroup.  $\square$

*Remark 0.9.*

$$\begin{aligned} SL(n) &= GL_n(\mathbb{R}) \cap SL_n(\mathbb{C}), \\ SU(n) &= SL_n(\mathbb{C}) \cap U(n), \\ SO(n) &= SL_n(\mathbb{C}) \cap O(n) \end{aligned}$$

are closed subgroups of  $GL_n(\mathbb{C})$ .

**Theorem 0.1.**  $U(n)$ ,  $O(n)$ ,  $SU(n)$  and  $SO(n)$  are compact.

*Proof.* Observe  $O(n)$ ,  $SU(n)$  and  $SO(n)$  are closed subgroups of  $U(n)$ . It is sufficient to show  $U(n)$  is compact.

**Goal:**  $U(n)$  is homeomorphic to a closed and bounded set of  $\mathbb{C}^{n^2}$ .

Observe  $GL_n(\mathbb{C})$  is an open subgroup of  $M_n(\mathbb{C})$ , hence it is also a closed subgroup according to a previous lemma. Observe  $U(n)$  is closed in  $GL_n(\mathbb{C})$  and  $GL_n(\mathbb{C})$  is closed in  $M_n(\mathbb{C})$  implies  $U(n)$  is closed in  $GL_n(\mathbb{C})$ .

Now for  $\sigma = (a_{ij}) \in U(n)$  if and only if

$${}^t\bar{\sigma}\sigma = \varepsilon \iff \sum_k a_{ki}\bar{a}_{kj} = \delta_{ij}.$$

$\square$

$$\sum_{k=1}^n |a_{ki}|^2 = 1$$

implies that for the  $i^{\text{th}}$  column vector, the absolute sum is 1. This implies for any  $1 \leq i, j \leq n$ ,  $|a_{ji}| \leq 1$ .

Now in  $(\mathbb{C}^{n^2}, \|\cdot\|_1)$ , let  $v = (v_k)_{k=1}^{n^2}$  where  $|v_k| \leq 1$  for  $1 \leq k \leq n^2$ . We define

$$\|v\|_1 = \max_{1 \leq k \leq n^2} |v_k|.$$

Observe  $f : M_n(\mathbb{C}) \rightarrow \mathbb{C}^{n^2}$  as a homeomorphism.  $f(U(n))$  is closed and bounded, and compact. This implies  $U(n)$  is compact.

$\square$

*Remark 0.10.* The choice of the norm does not matter as all norms in finite dimension vector space are equivalent (add the proof to that in the appendix).
